

Chronic Kidney Disease Intelligence

Chronic Kidney Disease Intelligence

Overview

Chronic Kidney Disease (CKD) is a progressive loss in renal function over a period of months or years. It is estimated that there are over 5.5 million patients in the UK with CKD, leading to the NHS spending over £1.5 billion per annum. Early identification of CKD can save lives and slowing down its progression will help to reduce the impact of the disease on your patients and relieve the burden on the NHS.

Our CKD Intelligence is a clinical dashboard which produces reports on all aspects of the disease from a Primary Care Perspective.

Use this clinical dashboard to identify any gaps in care and aid improvements in your patient management, advice and treatment including prompt referrals where indicated. The overall benefit you should see is the improvement of outcomes for patients and your practice alike.

Features of the Reports

There are a number of reports available for you to use:

- **Prevalence and Incidence** – This report gives you an understanding of your current CKD population. Showing the total number of patients within the Practice with a diagnosis of CKD and also the number of patients diagnosed within the last 12 months.
- **Patients Likely to Have** – This highlights patients whose data suggests that they may have CKD but a diagnosis has not been recorded on the Practice's clinical system. This report details patients who meet the current diagnostic criteria and also patients who have hospital data that indicates CKD.

- **Primary Prevention of CKD** – Identifies patients who are at risk of developing CKD and for example includes patients who are on nephrotoxic drugs.
- **Management of Patients with CKD** – Identifies where the Practice may be required to intervene. For example, the report highlights missing elements of care and also prompts where the criteria for referral to a nephrologist have been met (and no referral is recorded).
- **Lifestyle Management of Patients with CKD** – Enables you to monitor the lifestyle advice and referrals to appropriate services offered to patients.
- **Medicines Management of Patients with CKD** – This report identifies patients with CKD who are currently prescribed nephrotoxic drugs.

Benefits of the Solution

Use of the clinical dashboard will help you to:

1. Understand your patient population.
2. Support for the diagnosis of patients with CKD.
3. Reduce health inequalities.
4. Reduce hospitalisation by improving timely and appropriate referrals.
5. Reduce disease progression which will lead to cost savings.
6. Support NICE clinical pathways and Quality Standards.
